

Developer Update Checklist — Status Report

Report date: 2 August 2026 | Checklist issued: 30 July 2026 | All Critical & High items implemented and deployed

Critical — Done	High — Done	Status — Ready for QA
-----------------	-------------	-----------------------

Payment for this milestone is released only after Anthony has personally tested and approved every item on the original checklist. This report confirms development completion and readiness for the 10 acceptance tests on real iPhone and Android devices.

Executive Summary

All items on the **Developer Update Checklist — Next Release** are **Done** in code and deployed to the linked Supabase project. Remaining work is **client device sign-off** only.

Area	Items	Result
01 Gemini AI Images	1.1 – 1.3	Done
02 Image Caching	2.1 – 2.5	Done
03 Search Relevance	3.1 – 3.5	Done
04 Smart Pagination	4.1 – 4.5	Done

01 Gemini AI Images — All Recipe Images Must Be AI Generated

Every recipe displayed anywhere in the app must show a Gemini AI generated image. No placeholder icons, no missing images, no broken image states.

#	Item	Priority	Status	Notes
1.1	Gemini image generation on every recipe	Critical	Done	upgrade-recipe-image + background upgrades on Explore, Home, Saved, scan results, Cook Mode. Batch cap raised to 25.
1.2	Every screen that shows a recipe must show a Gemini image	Critical	Done	RecipeThumbnailImage on all main surfaces; missing/broken images use green pulse while upgrading.
1.3	Graceful loading state while image generates	High	Done	Quillo-green pulsing skeleton (not broken icons / empty white space).

02 Image Caching — Generate Once, Serve Forever

Every generated image is stored permanently and served from cache. Gemini must not be called twice for the same recipe.

#	Item	Priority	Status	Notes
2.1	recipe_images table checked on every request	Critical	Done	Migration 016; lookup before Gemini in gemini_image.ts.
2.2	Upload to Storage + recipe_images row	Critical	Done	Uploads to recipe-images bucket; upserts recipe_images with title, url, source, prompt.
2.3	Cached image shared across all users	Critical	Done	Public Storage + shared recipe_images / recipes.image_url.
2.4	Never call Gemini twice for same recipe_id	Critical	Done	Unique recipe_id; status=generating lock; waiters poll for ready (migration 017).

2.5	Image compression before storage	High	Done	WebP/JPEG ~85% with progressive resize until ≤200KB.
-----	----------------------------------	------	------	--

03 Search Must Return Correct and Relevant Results

Explore search must be accurate and respect onboarding preferences. A search for steak must return steak recipes.

#	Item	Priority	Status	Notes
3.1	Query maps correctly to Edamam / Spoonacular	Critical	Done	Raw term passed as q= / query= with no synonym override.
3.2	Dietary preferences filter automatically	Critical	Done	Edamam health/diet/time + Spoonacular diet/intolerances/cuisine/maxReadyTime + post-filter.
3.3	Results de-duplicated across APIs	High	Done	Normalized lowercase title merge.
3.4	Empty search state handled correctly	High	Done	"No recipes found for [term]. Try a different ingredient or dish name."
3.5	Search results must be fast	High	Done	Skeleton after 2s; timeout at 5s with Retry; local cache fallback.

Client-reported fix: Search for "steak" no longer returns unrelated tuna/fish from noisy DB ingredient matches. Title ranking + always call Edamam + drop weak local ingredient-only hits (migration 015).

04 Smart Search Pagination — Load 5, Cache Next 5

First 5 results load immediately; next 5 are fetched and cached in the background so the user never waits.

#	Item	Priority	Status	Notes
4.1	First 5 results load immediately on search	Critical	Done	Page size 5; saved to recipe_cache with positions; also local SQLite cache.
4.2	Next 5 fetched silently in background	Critical	Done	Client silent prefetch after first page returns.
4.3	Pagination continues for subsequent pages	Critical	Done	Continues after Load more; has_more / offset / exclude_ids.
4.4	Cached search results serve all users	Critical	Done	Shared recipe_cache + search_popularity before live API when warm.
4.5	Cache keyed by normalised search term	High	Done	Lowercase trimmed term on server and device.

Acceptance Tests — Anthony Will Check These Before Sign-Off

No milestone payment will be released until all 10 acceptance tests pass on a real device. Please test on both an iPhone and an Android device.

#	Test	Expected Result	Dev Status
1	Search chicken — check every result has an image	All cards show Gemini food photography. No missing images / broken icons.	Ready to verify
2	Search steak — check results are steak recipes	Every result is a steak/beef dish. No unrelated fish/pasta clutter.	Ready to verify
3	Scroll to bottom of first 5 results	Next 5 load instantly with no spinner (prefetched).	Ready to verify
4	Scroll to result 10	Results 11–15 load instantly (pre-cached).	Ready to verify
5	Search chicken on two different accounts	Second account gets cached results; no duplicate Gemini call.	Ready to verify

6	Open a recipe never viewed before	Gemini generates within ~5s; recipe_images row created.	Ready to verify
7	Open same recipe on a different account	Image loads instantly from cache; no Gemini call.	Ready to verify
8	Set halal in preferences, search beef	No pork in results; halal-compliant.	Ready to verify
9	Set 20 minute cook limit, search pasta	No result shows cook time above 20 minutes.	Ready to verify
10	Search with no internet connection	Cached results load from device; app does not crash.	Ready to verify

Deployments Included

Asset	Action
015_search_relevance_ranking.sql	Applied
016_recipe_images_and_search_cache.sql	Applied
017_recipe_images_generation_lock.sql	Applied
Edge function search-catalog	Deployed
Edge function upgrade-recipe-image	Deployed
Flutter client (Explore / Home / Saved / Scan / Cook Mode)	Updated — hot restart / new build required

Known Residual Risks

- Gemini may be slow or rate-limited under load; UI shows green pulse until ready.
- First search for a brand-new term still hits Edamam (expected); later users/pages should hit recipe_cache.
- Offline search only works for terms previously searched successfully on that device.
- AdMob live banner units may still fail until the AdMob account fully activates (outside this checklist; debug builds use Google test ads).

Suggested Upwork Reply

Hi Anthony —

Status update for the 30 July Developer Checklist (report date 2 Aug 2026):

All checklist items (Critical + High) are Done in code and deployed (migrations 015–017, search-catalog, upgrade-recipe-image, Flutter client).

Please run the 10 acceptance tests on iPhone and Android. I'll support any fails you find.

Notable fixes since last review:

- Steak/chicken search relevance (no more unrelated fish from DB ingredient noise)
- Gemini images + shared recipe_images cache with race lock and WebP ≤200KB
- Smart pagination with silent prefetch + shared/offline search cache
- Search UX: 2s skeleton, 5s timeout + retry

Looking forward to your device sign-off.
